

ACCESS / VANDALISM

The new design prevents unauthorized access

A great benefit of using our designs in areas where unauthorized access is an issue, is that the pylon design uses a robust, tubular shaft for the first 15-20 meters above ground, making it impossible to climb and/or access for non-maintenance personnel.

Furthermore, the shaft of the pylon at ground level is remarkably robust without external additions, meaning there is nothing which can be stolen or removed. For example, the ground wire and bolt flanges, where the pylon is mounted to the foundation, are placed inside the pylon where they cannot be accessed or removed.
